<p>This report presents a detailed analysis of the Ambulatory CHAMPUS Data for FY92. The source of the data was the Tri-Service CHAMPUS Statistical Database Project (TCSDBP). The detailed report includes numerous tables on the demographic distributions based on several criteria such as billable MTF, sex and age. The total numbers of visits and services, the totals paid by the government, the patient and other sources, computed also as percentages of grand total for each category were presented. Several statistical tests and the resulting conclusions about relationship between sponsor's branch of service and variables of interest (like age, sex, leading diagnoses and procedures are included).</p>

CHAMPUS AMBULATORY DATA ANALYSIS DETAILED REPORT

SUMMARY

This report presents a detailed analysis of the ambulatory CHAMPUS data within the Department of Defense's Civilian Health and Medical Program for the Uniformed Services (CHAMPUS). The Tri-Service CHAMPUS Statistical Database Project's (TCSDP) main relational database was the source of all the data used in this report. The analysis was done for Fiscal Year 1992 at the billable Medical Treatment Facility (MTF) level. Demographics for outpatients were obtained for each branch of service by billable MTF, age, and sex. An overall summary is shown in Table 1. It presents the total number of visits, number of services and amount paid by the government broken out by the three branches of service.

Appendix A summarizes, by sex and age, the total number of visits and services as well as the total amounts paid by the government, the patient and by other sources for each billable MTF within each branch of service. It also summarizes, for each branch of service, the percentage of visits, services, and government pay for each billable MTF. Appendix A also includes totals and percentages for the 'Outside Catchment Area' category, which covers all patients not associated with a billable MTF.

Appendices B through D present the results of the chi-square analysis regarding age and sex distributions and nonparametric measures of association between the number of services and the 100 leading diagnoses and procedures respectively.

DISCUSSION

Distribution Analysis

Table 1 shows a consistent trend. The Navy was highest in all three measures, followed by the Air Force, and the Army was the lowest. No branch accounted for a large proportion of the workload of government pay. The approximate number of visits (in millions) were 4.5 for the Navy, 4.4 for the Air Force, and 4.1 for the Army. The number of services were about 12.0 million, 11.6 million and 10.3 million, for the Navy, Air Force and Army, respectively. The amounts of government payments were approximately \$392.7 million for the Navy, \$370.7 million for the Air Force and 305.1 million for the Army.

Results in Appendix A show, that the largest proportion of workload and costs were in the category 'Outside Catchment Area'. The total government pay for outside catchment area category was 39.64% for the Army, 30.66% for the Navy, and 25.82% for the Air Force. There were 1,305,647 visits, and 3,995,484 services outside the Navy catchment area, with the amount the government

paid equaled to \$120,408,108. Patients outside the Air Force catchment area had 1,070,087 visits, 3,388,056 services, and the government paid was \$95,699,259. In the Army there were 1,358,395 visits and 4,133,645 services outside the catchment area, and the amount of government payments was \$120,945,195.

In the Fiscal Year 1992 there were 70 billable Medical Treatment Facilities in the Air Force, 38 in the Army and 28 in the Navy. For the Navy, the leading billable MTFs were: NAVHOSP SAN DIEGO with 12.36% of the Navy's total (\$48,538,856) and 1,160,080 services; NAVHOSP LONG BEACH with 10.30% (\$40,436,840) and 887,752 services; and NAVHOSP PORTSMOUTH with 9.32% (\$36,589,499) and 1,457,318 services. MACDILL REG HOSP MACDILL AFB had the highest amount of total government pay in the Air Force's billable MTF. It accounted for 4.13% (\$15,306,824) of the Air Force's total. The total number of services were 437,563. MARCH REG HOSP MARCH AFB was second with government pay totalling \$13,952,681 (3.76% of the total). The total number of services were 303,571. USAF REG HOSP CARSWELL AFB came third with 3.46% of the total (\$12,840,471), and the total services were 384,167. The leading billable MTFs in the Army, in terms of total government pay, were: DEWITT AH FT BELVOIR accounting for 3.96% of the Army's total (\$12,083,612). The number of services totaled 487,347; DARNALL AH FT HOOD with 3.66% (\$11,167,385). The total number of services were 458,683; and TRIPLER AMC with 3.35% (\$10,226,584). The total number of services were 91,662.

Chi-square Analysis and Measures of Association

Part of the study was performed to analyze the age and sex distribution. Both were treated as categorical variables. Hypothesis testing was carried out to determine whether the four branches of service (Army, Air Force, Navy and Marines) were homogeneous with respect to the proportion of patients falling into each of the two sex categories, or into each of the twelve age categories. The two hypotheses were tested by means of a chi-square test of classification. The test procedures involved comparing the actual number of observations in each cell of the contingency table, to that expected if the specified null hypothesis were true. If the differences observed were too large to have occurred by chance, then the null hypothesis was rejected. The multinomial distribution theory was used for the test statistics.

The first chi-square test of homogeneity was performed for the sex distribution. The sex variable could take one of two possible values (male=1, female=2). The sample size included 23,319,348 patients. The male gender accounted for 34.02% of the total DOD population, 33.99% of the Army, 35.57% of the Air Force, 32.30% of the Marines, and 32.89% of the Navy. The value of the chi-square statistic was 14178.062, which gave the p value equal to zero ($p=0$). The null hypothesis, that all the sponsor's

branches of service have the same patient sex distribution, was rejected. It was concluded that the patients using CHAMPUS Ambulatory facilities differ in their gender distribution in each sponsor's branch of service.

It was concluded in the second test of homogeneity that the population of outpatients in the four branches of service were not homogeneous with respect to the patients' age. The total number of patients included in the test were 23,319,348. The value for the chi-square test statistics was equal to 631221.96, which made $p=0$. Therefore, the statistical decision was to reject the null hypothesis that the populations of outpatients were homogeneous with respect to age. The conclusion is that the outpatients in the four branches of service should be viewed as separate populations with regards to the age distribution.

Based on these results, one can say that the sex and age of the patients are distributed differently by sponsor's branch of service.

Two other tests were performed to analyze nonparametric measures of association. First, the top 100 diagnoses for each sponsor's branch of service were compared, and a set of measures of association and their asymptotic standard errors were computed. The total number of services for the first 100 diagnoses in each sponsor's branch of service were summed together and used as the sample size (13,086,497 services). The value of the chi-square statistic was 2,308,812.1, which gives a p value equal to zero. The Spearman rank correlation coefficient was 0.018, the Kendall's Tau-b was 0.013 and all the other coefficients were also close to zero. All the measures of association such as Spearman rank correlation coefficient, Lambda, Gamma, Kendall's Tau-b, Somers'D, showed very little association between the leading diagnoses and the services. It was concluded that the number of services associated with each leading diagnosis are different for each sponsor's branch of service.

A similar conclusion can be drawn when comparing the measures of association between the 100 leading procedures and the four branches of service. The total number of observations used was 19,565,725 (services). The value of the chi-square statistic was 1,157,825.1, with $p=0$. The Spearman rank correlation coefficient was equal to 0.017, the Kendall's Tau-b was equal to 0.013, gamma statistic was 0.016. There is no correlation between the leading procedures, which were treated as ordinal categories, and the four branches of service.

It means that the distribution of services for each sponsor's branch of service are not homogeneous. The above analyses show that each branch of service should be treated separately.
